

Most of the ET VB6 were started in GWBASIC and then ported QB one version at time. This was just my way of taking notes on how to do things and making quick evaluations on equations for different functions and fractals. They were finely compiled with QB45. They were put together VB3 and eventually updated to VB6. I had kept these notes for a long time in my archives but no longer have them for what ever reason. So, I decided to convert them back in QB, but this time compiled with QB64. This way I can run them directly on my Windows 10 x64 machine instead of running qb45 in the DosBox.
