

Anaconda

I downloaded Anaconda 3.7 from the official website. It was very cool and ran all my stuff without adding any libraries. However, it did not work with the Visual Studio Python Support as is. I removed it and installed it with the version that is installed with the Python Support for VS. So, I will be using Anaconda 3.6. All Python 3.6 programs that I have worked with Anaconda 3.6. in VS 2017. Everything tested ok with Spyder also. When I started using turtle, I had problems with Spyder, but VS works.

Anaconda is cool and it is good for up and running with no fuss. I will be switching to Python 3.7 again. I will make sure I test the Python IDLE for everything also.
